Detailed Description of Invention

Technical Field

The present invention relates to a phenyl or heteroaryl amino alkane derivatives which are useful as an active ingredient of pharmaceutical preparations. The phenyl or heteroaryl amino alkane derivatives of the present invention have IP receptor antagonistic activity, and can be used for the prophylaxis and treatment of diseases associated with IP receptor antagonistic activity.

More specifically, the phenyl or heteroaryl amino alkane derivatives of the present invention are useful for treatment and prophylaxis of urological diseases or disorders.

The compounds of the present invention are also useful for treatment of pain; hypotension; hemophilia and hemorrhage; inflammation; respiratory states from allergies or asthma, since the diseases also is alleviated by treatment with an IP receptor antagonist.

BACKGROUND ART

Prostaglandins (or prostanoids, PGs) are a group of bioactive lipid mediators generated from membrane phospholipids. They are formed from 20-carbon essential fatty acids containing 3, 4, or 5 double bonds, and carry a cyclopentane ring. They are divided into 6 main classes (D, E, F, G, H or I) by the cyclopentane ring structure. The main classes are further subdivided by subscripts 1, 2, or 3, reflecting their fatty acid precursors. PGI₂ is a member of prostanoids, and it has a double ring structure and is derived from arachidonic acid. The receptor for PGI₂ is a seven transmembrane G-protein coupled receptor, called prostacyclin receptor (IP). IP

- 2 -

couples at least to Gs-type G-protein, and activates adenylate cyclase and phospholipase C. The expression of IP is demonstrated in aorta, coronary/pulmonary/cerebral arteries, platelets, lung, and dorsal root ganglions in addition to several other tissues.

5

One of the well-known actions of PGI₂ on blood vessels is to cause vasodilation and hypotension. Especially in septic shock, PGI₂ is produced and participates in the induction of systemic hypotension (G.D. Bottoms et al, Am J Vet Res 1982, 43(6), 999-1002). Therefore, IP receptor antagonists may prevent hypotension associated with septic shock.

10

Another well-known action of PGI₂ on platelets is to suppress aggregation. In the IP receptor knock out mice, FeCl₃-induced thrombosis formation was enhanced in comparison with that in wild type mice (T. Murata et al, Nature 1997, 388, 678-682), confirming the involvement of IP receptor in the platelet inhibition. Therefore, IP receptor antagonists may enhance the platelet activation and suppress excessive bleeding such as, but not limited to, hemophilia and hemorrhage.

15

PGI₂ also participates in the inflammation. In the inflamed tissue, various inflammatory mediators, including prostaglandins, are produced. PGI₂ is also generated and induces vasodilation to increase blood flow. This enhances vascular permeability, edema formation and leukocyte inflammation in the inflamed region (T. Murata et al, Nature 1997, 388, 678-682). Therefore, PGI₂ receptor antagonists may be efficacious for the treatment of inflammation.

20

25

PGI₂ may be involved in the pathogenesis of respiratory allergy or asthma. It is spontaneously generated and the major prostaglandin in human lung, and the appropriate antigen challenge increases PGI₂ production (E.S. Schulman et al, J Appl Physiol 1982, 53(3), 589-595). Therefore, IP antagonists may have a utility for the treatment of those respiratory diseases.

30

- 3 -

In addition, an important role of IP receptor in the induction of hyperalgesia has been clearly shown by IP receptor knockout mice (T. Murata et al., Nature 1997, 388, 678-682.). Injection of acetic acid into the peritoneal cavity induced production of PGI₂. This PGI₂ is considered to bind to IP receptor on sensory neurons. As IP
5 receptor couples to the activation of both adenylate cyclase and phospholipase C, cAMP-dependent protein kinase (PKA) and protein kinase C (PKC) are activated. PKA and PKC are known to modulate ion channels on sensory neurons such as VR1, P2X₃, and TTX-R. As a result, PGI₂ sensitizes sensory neurons to enhance the release of neurotransmitters. An acetic acid injection induces nociceptive response
10 (writhing) in mice and this acetic acid-induced writhing was greatly reduced in IP receptor-null mice as the same level as indomethacin-treated wild type mice. Several other in vivo hyperalgesia studies in rodents and in vitro studies further support that PGI₂ plays a major role in the induction of hyperalgesia and that PGI₂ acts as important modulator of sensory neurons (K. Bley et al, Trends in Pharmacological
15 Sciences 1998, 19(4), 141-147). Therefore, IP receptor antagonists may be useful for the treatment of pain.

Sensory neurons play very important roles not only in the pain sensation but also in the sensation of bladder distension. In normal subjects, A-delta sensory fibers are
20 considered to play a major role to sense the bladder distention. However, in disease conditions of overactive bladder by, but not limited to, spinal cord injury, cystitis, Parkinson's disease, multiple sclerosis, previous cerebrovascular accident, and bladder outlet obstruction (BOO) caused by benign prostate hyperplasia (BPH), the sensitivity of C-fiber sensory neurons is upregulated and they contribute to the
25 induction of the lower urinary tract symptoms. Treatment of overactive bladder patients with intravesical injection of capsaicin or its potent analog, resiniferatoxin, both of which desensitize VR1-positive C-fiber afferent neurons innervating the bladder, has been shown to be efficacious in several clinical trials (C. Silva et al, Eur Urol. 2000, 38(4), 444-452). Therefore, C-fiber sensory neurons play an important
30 role in the pathology of overactive bladder. PGI₂ is generated locally in the bladder and it is the major prostaglandin released from the human bladder. In a rabbit BOO

- 4 -

model, a stable metabolite of PGI₂ was reported to be increased in BOO bladder (JM. Masick et al, Prostaglandins Other Lipid Mediat. 2001, 66(3), 211-219). Hence, PGI₂ from disease bladder sensitizes C-fiber sensory neurons, and as a result, it may induce symptoms of overactive bladder. Therefore, antagonists of IP receptor are expected to be useful in the treatment of overactive bladder and related urinary disorders.

The formulation may be in unit dosage form, which is a physically discrete unit containing a unit dose, suitable for administration in human or other mammals. A unit dosage form can be a capsule or tablets, or a number of capsules or tablets. A "unit dose" is a predetermined quantity of the active compound of the present invention, calculated to produce the desired therapeutic effect, in association with one or more excipients. The quantity of active ingredient in a unit dose may be varied or adjusted from about 0.1 to about 1000 milligrams or more according to the particular treatment involved.

10

Typical oral dosages of the present invention, when used for the indicated effects, will range from about 0.01 mg/kg/day to about 100 mg/kg/day, preferably from 0.1 mg/kg/day to 30 mg/kg/day, and most preferably from about 0.5 mg/kg/day to about 10 mg/kg/day. In the case of parenteral administration, it has generally proven advantageous to administer quantities of about 0.001 to 100 mg/kg/day, preferably from 0.01 mg/kg/day to 1 mg/kg/day. The compounds of the present invention may be administered in a single daily dose, or the total daily dose may be administered in divided doses, two, three, or more times per day. Where delivery is via transdermal forms, of course, administration is continuous.

Examples

5 The present invention will be described in detail below in the form of examples, but they should by no means be construed as defining the meets and bounds of the present invention.

In the examples below, all quantitative data, if not stated otherwise, relate to percentages by weight.

10 Melting points are uncorrected. Liquid Chromatography - Mass spectroscopy (LC-MS) data were recorded on a Micromass Platform LC with Shimadzu Phenomenex ODS column (4.6 mm x 30 mm) flushing a mixture of acetonitrile-water (9:1 to 1:9) at 1 ml/min of the flow rate. Mass spectra were obtained using electrospray (ES) ionization techniques (micromass Platform LC). TLC was
15 performed on a precoated silica gel plate (Merck silica gel 60 F-254). Silica gel (WAKO-gel C-200 (75-150 μ m)) was used for all column chromatography separations. All chemicals were reagent grade and were purchased from Sigma-Aldrich, Wako pure chemical industries, Ltd., Great Britain, Tokyo kasei kogyo Co., Ltd., Japan, Nacalai tesque, Inc., Watanabe Chemical Ind. Ltd., Maybridge plc,
20 Lancaster Synthesis Ltd., Great Britain, Merck KgaA, Germany, Kanto Chemical Co., Ltd. ^1H NMR spectra were recorded using either Bruker DRX-300 (300 MHz for ^1H) spectrometer or Bruker 500 UltraShieldTM (500 MHz for ^1H). Chemical shifts are reported in parts per million (ppm) with tetramethylsilane (TMS) as an internal standard at zero ppm. Coupling constant (J) are given in hertz and the
25 abbreviations s, d, t, q, m, and br refer to singlet, doublet, triplet, quartet, multiplet, and broad, respectively. The mass determinations were carried out by MAT95 (Finnigan MAT).

[Measurement of the [^3H]-iloprost binding to HEL cells] (Assay 1)

A human erythroleukemia cell line, HEL 92.1.7, was purchased from American Type Culture Collection and maintained in RPMI-1640 medium (Gibco BRL) supplemented with 10% fetal calf serum (FCS), 2 mM glutamine, 4.5 g/L glucose, 10 mM Hepes, 1 mM sodium pyruvate, 100 U/ml penicillin, and 100 $\mu\text{g/ml}$ streptomycin in a humidified 5% CO_2 atmosphere at 37°C. Cells were collected with centrifugation and washed with binding assay buffer (BAB: 50 mM Tris-HCl, 5 mM MgCl_2 (pH 7.5)). Cells were suspended at the density of 6.25×10^6 cells/ml in BAB, and one million cells in 160 μl aliquot of cell suspension were put in a well of 96 well plate (Falcon). Then, 20 μl of compound solution, 100 μM of iloprost (for non-specific binding), or buffer alone (total binding), diluted with 1% DMSO in BAB was added. Finally, another 20 μl containing [^3H]-iloprost (0.02 μCi , 0.5-1 pmol) in BAB was added and incubated at room temperature for 30 min with a gentle shaking. Cell suspension was then transferred to a well of MultiScreen plate with GF/C glass filters (Millipore) to harvest cells. Cells were washed twice with 200 μl of ice-cold BAB and the plate was kept at 55°C for 30 min to dry filters. The filter in the well was punched out to a counting tube and 2 ml of Ultima Gold XR (Packard) was added. [^3H]-radio activity in the filter was measured by a liquid scintillation counter (Beckman, USA).

[Iloprost-induced cAMP production assay in HEL cells] (Assay 2)

HEL cells were collected with centrifugation and washed with cAMP assay buffer (CAB: Hank's balanced salt solution, 17 mM Hepes, 0.1% bovine serum albumin, 1 mM IBMX, 0.4% DMSO, and 1 mM L-ascorbic acid sodium salt (pH 7.4)). Cells were suspended at the density of 2.5×10^5 cells/ml in CAB, and twenty thousand cells in 80 μl aliquot of cell suspension were put in a well of 96 well plate (Falcon). Then, 10 μl of compound solution diluted with 1% DMSO in CAB or buffer alone was added. The plate was incubated at 37°C for 30 min. Then, another 10 μl containing 100 nM iloprost in CAB or buffer alone was added and further incubated at 37°C

[Measurement of rhythmic bladder contraction in anesthetized rats]

5

(1) Animals

Female Sprague-Dawley rats (200~250 g / Charles River Japan) were used.

10

(2) Rhythmic bladder contraction in anesthetized rats

15

Rats were anesthetized by intraperitoneal administration of urethane (Sigma) at 1.25 g/kg. The trachea was cannulated with a polyethylene tube (HIBIKI, No. 8) to facilitate respiration; and a cannula (BECTON DICKINSON, PE-50) was placed in the left femoral vein for intravenous administration of testing compounds. The abdomen was opened through a midline incision, and after both ureters were cut, a water-filled balloon (about 1 ml capacity) was inserted through the apex of the bladder dome. The balloon was connected to a pressure transducer onto a polygraph. Rhythmic bladder contraction was elicited by raising up intravesical pressure to approximately 15 cm H₂O. After the rhythmic bladder contraction was stable, a testing compound was administered intravenously. Activity was estimated by measuring disappearance time and amplitude of the rhythmic bladder contraction. The effect on amplitude of bladder contractions was expressed as a percent suppression of the amplitude of those after the disappearance was recovered. Experimental values were expressed as the mean±S.E.M. The testing compounds-mediated inhibition of the rhythmic bladder contraction was evaluated using Student's t-test. A probability level less than 5% was accepted as significant difference.

5

To a solution of ethyl *N*-{6-[4-(benzyloxy)phenyl]pyrimidin-4-yl}-3-{2-[(tert-butoxycarbonyl)amino]ethoxy}phenyl alaninate (47.0 mg, 0.080 mmol) in ethanol (1.0 mL) was added 1N LiOH aqueous solution (0.12 mL, 0.12 mmol) and the mixture was stirred at room temperature for 3 hours. The mixture was neutralized with 1N HCl (0.12 mL) and partitioned between ethyl acetate and water, washed with brine, dried over sodium sulfate and concentrated under reduced pressure. The residue was dissolved in methanol (1.0 mL). A 4N solution of HCl in dioxane (1.0 mL, 4.0 mmol) was added to the solution, which was kept at room temperature overnight. The volatiles were evaporated off, and the residual solid was triturated with ethyl ether to give a crude powder, which was recrystallized from a mixture of THF and water to give 3-(2-aminoethoxy)-*N*-{6-[4-(benzyloxy)phenyl]pyrimidin-4-yl}phenylalanine (13.7 mg, 37 %) as a colorless powder.
